# Machine Learning Course
LSI, 2022

Pr. Khadija SLIMANI

20/01/2022

What is this course about

- Learn about Data Science

- Learn about machine learning and its applications

- How to build machine learning systems

- How the algorithms behind them work

- How to use those algorithms

Course planning

- A Case study approach:
  - Course
  - Practical work (case study)

| Week 1	Week 1	Week 3	Week 7	Week 8

Assignment

Course overview

1. Week 1 : Introduction to Data Science and Machine Learning

   1. Introduction to Data Science

   2. Introduction to Machine Learning

   3. Machine Learning Tools

2. ….

1.1
Introduction to Data Science

The Era of Big Data

▸ **90%** of the information ever generated was generated in the last two years?

Every minute we send 2014 million emails, generate 1,8 million Facebook likes, send 278,000 Tweets, and upload 200,000 photos to Facebook
Source

Around 100 hours of video are uploaded to Youtube every minute and it would take you around 15 years to watch every video uploaded by users in one day
Source

If you burned all of the data created in just one day onto DVD's, you would stack them on top of each other and reach the moon - twice
Source

▸ This growing torrent of data + growing storage and computation capacity (cloud) ⇒ **Big Data Era**

What is Data Science ?

▸ It goes back a little further than 2004, which is where the Google search term history begins

▸ Data Science is not just limited to tech companies

  ▸ Almost every company is turning to data science to better understand how to build products, serve customers and leverage new opportunities

▸ Data Science is used in multiple disciplines: computer science, behavioural sciences, law & business, etc..

▸ All of these actors need data-driven methodologies to aid in their discovery:

 ▸ From statistical analysis, machine learning, & text mining to information visualization

What is Data Science ?

▸ Data Science is an umbrella term and it's basically the marriage of many different fields.
What is Data Science ?

▸ Definition of Data Science according to "**Drew Conway**"

- **Programming**
  - Get Data
  - Manipulate Data
  - Explore Data
  - Build Models
  - Implement Models

Hacking Skills

Data Science

Maths & Stats

- Foundational **Statistics**
- Internals of **Algorithms**
- **Practical Knowledge** and Experience

Domain Knowledge

- Understand the Business Problem
- Understanding of the Data

http://drewconway.com/zia/2013/3/26/the-data-science-venn-diagram

What is Data Science ?

Data Science

- David Donoho, "50 Years of Data Science"
    1. Data Exploration and Preparation
    2. Data Representation and Transformation
    3. Computing with Data
    4. Data Modeling
    5. Data Visualization and Presentation
   6. Science about Data Science

1.2
Introduction to Machine Learning

What is Machine Learning ?

▸ Artificial Intelligence (AI) and Machine Learning (ML) are the part of computer science that are correlated with each other.

▸ These two technologies are the most trending technologies which are used for creating intelligent systems.

ARTIFICIAL INTELLIGENCE
A technique which enables machines to mimic human behaviour

MACHINE LEARNING
Subset of AI technique which use statistical methods to enable machines to improve with experience

DEEP LEARNING
Subset of ML which make the computation of multi-layer neural network feasible

What is Machine Learning ?

▸ Researchers interested in artificial intelligence wanted to see if computers could learn from data.

▸ **ML is not a new science**: many machine learning algorithms have been around for a long time

What is Machine Learning ?

▸ BUT, **it is a science that's gaining fresh momentum**: the ability to automatically apply complex mathematical calculations to **big data –over and over, faster and faster** – is a recent development
What is Machine Learning ?

▸ **Google trends for the term "Machine Learning"**

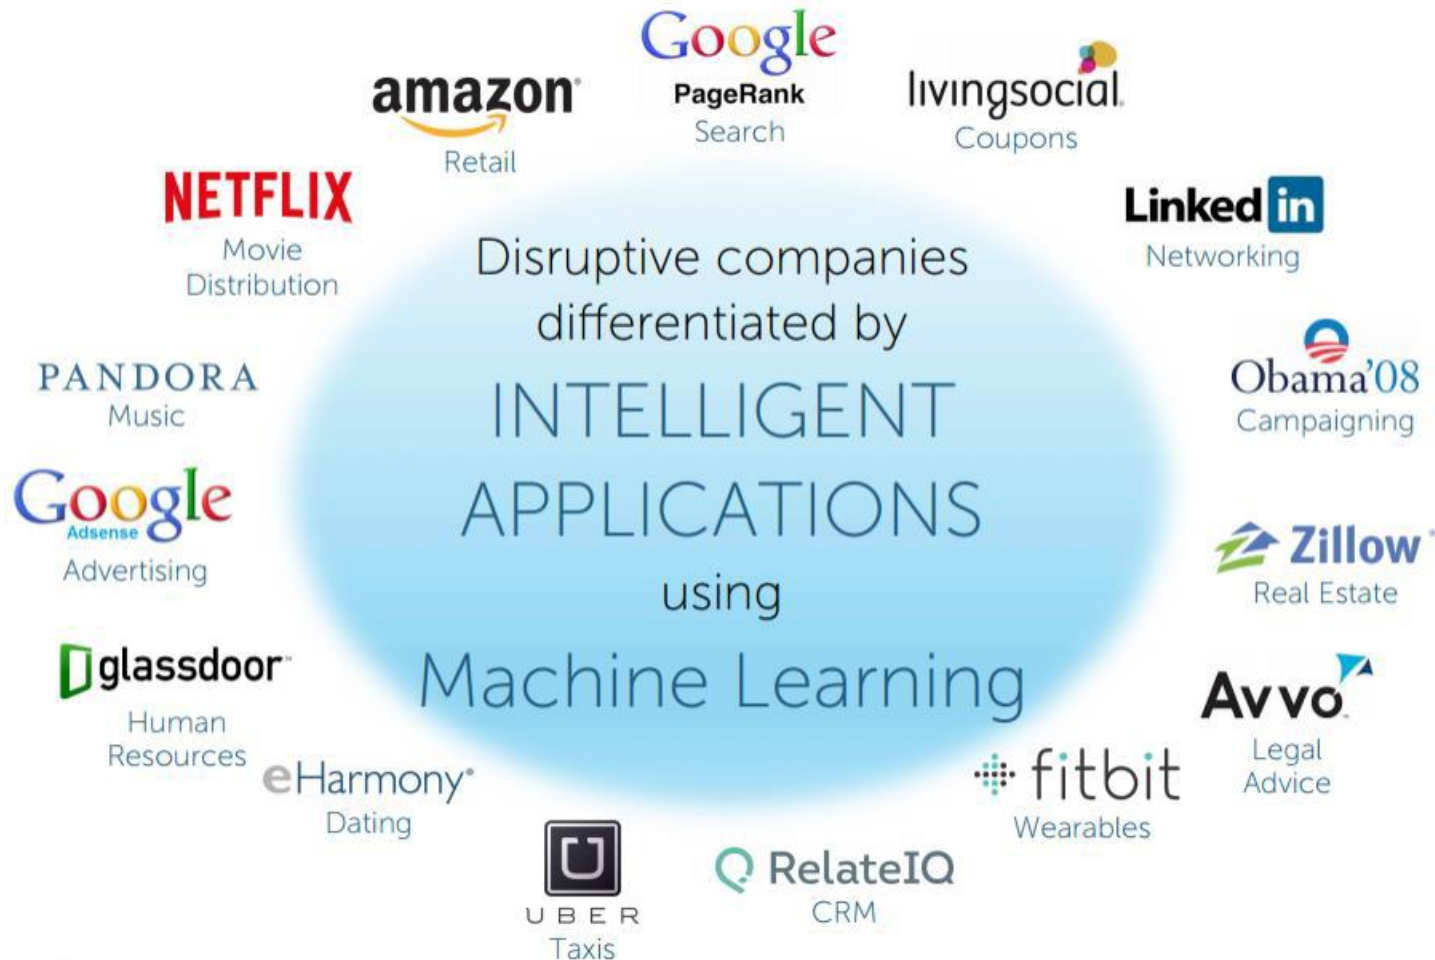

Interest over time
Definition of Machine Learning

▸ Machine learning is the subfield of computer science that "gives computers the ability to learn **without being explicitly programmed"** (Arthur Samuel, 1959)

▸ A more modern definition by Tom Mitchell: **"A computer program is said to learn from experience E with respect to some class of tasks T and performance measure P, if its performance at tasks in T, as measured by P, improves with experience E."**

▸ Example: playing checkers.
  ▸ E = the experience of playing many games of checkers
  ▸ T = the task of playing checkers.
 ▸ P = the probability that the program will win the next game

▸

Old View of Machine Learning
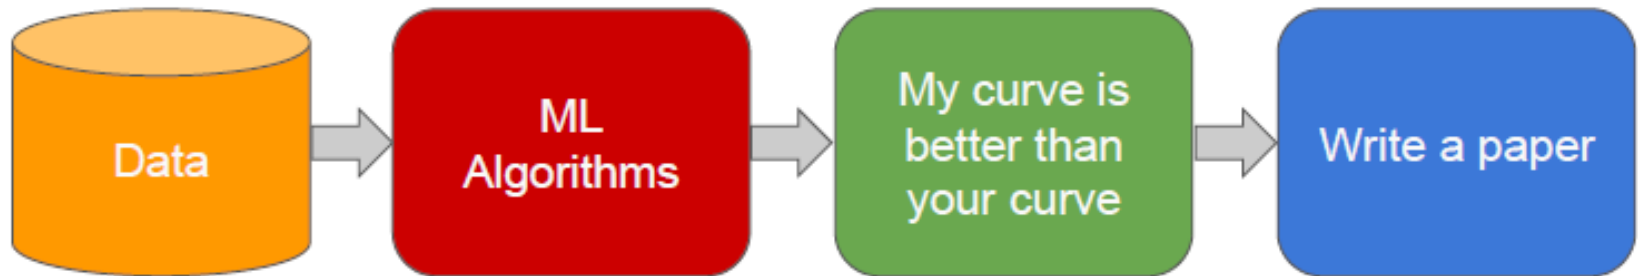

Machine Learning in Intelligent Applications

The pipeline of Machine Learning

Training

Input past data → **Machine learning Algorithm** → **Building Logical Models** → **Output**

Learn from data

New data

Types of Machine Learning

▸ Machine learning tasks are typically classified into **three broad categories.**

Supervised Learning	Unsupervised Learning	Reinforcement Learning

▸ Depending on the nature of the learning "signal" or "feedback" available to a learning system

▸

Supervised Learning

▸ The program is given a data set and already know what our correct output should look like

  ▪ Having the idea that there is a relationship between the input and the output

▸ The goal is to learn a general rule that maps inputs to outputs.

Regression

❑ Predict results within a continuous output,

❑ ⇒ map input variables to some continuous function

Housing price prediction.
Classification

❑ predict results in a discrete output.

❑ ⇒ map input variables into discrete categories

Unsupervised Learning

▸ **No labels** are given to the learning algorithm, leaving it on its own to find structure in its input.

▸ Unsupervised learning can be a goal in itself (discovering hidden patterns in data) or a means towards an end (feature learning)
Clustering

❑ Group similar samples into sets.

❑ ⇒ Find structure within the data

Customer segmentation

Dimensionality Reduction

❑ Intelligently reduce the number of features considered

❑ ⇒ Data compression, or Data visualization

Armadillo 3D

PCA, build time: 0:00:00

Reinforcement Learning

▸ A computer program interacts with a dynamic environment in which it must perform a certain goal, without a teacher explicitly telling it whether it has come close to its goal.

  ▸ Learning to drive a car (Google Car)
  ▸ Learning to play a game by playing against an opponent (AlphaGo)
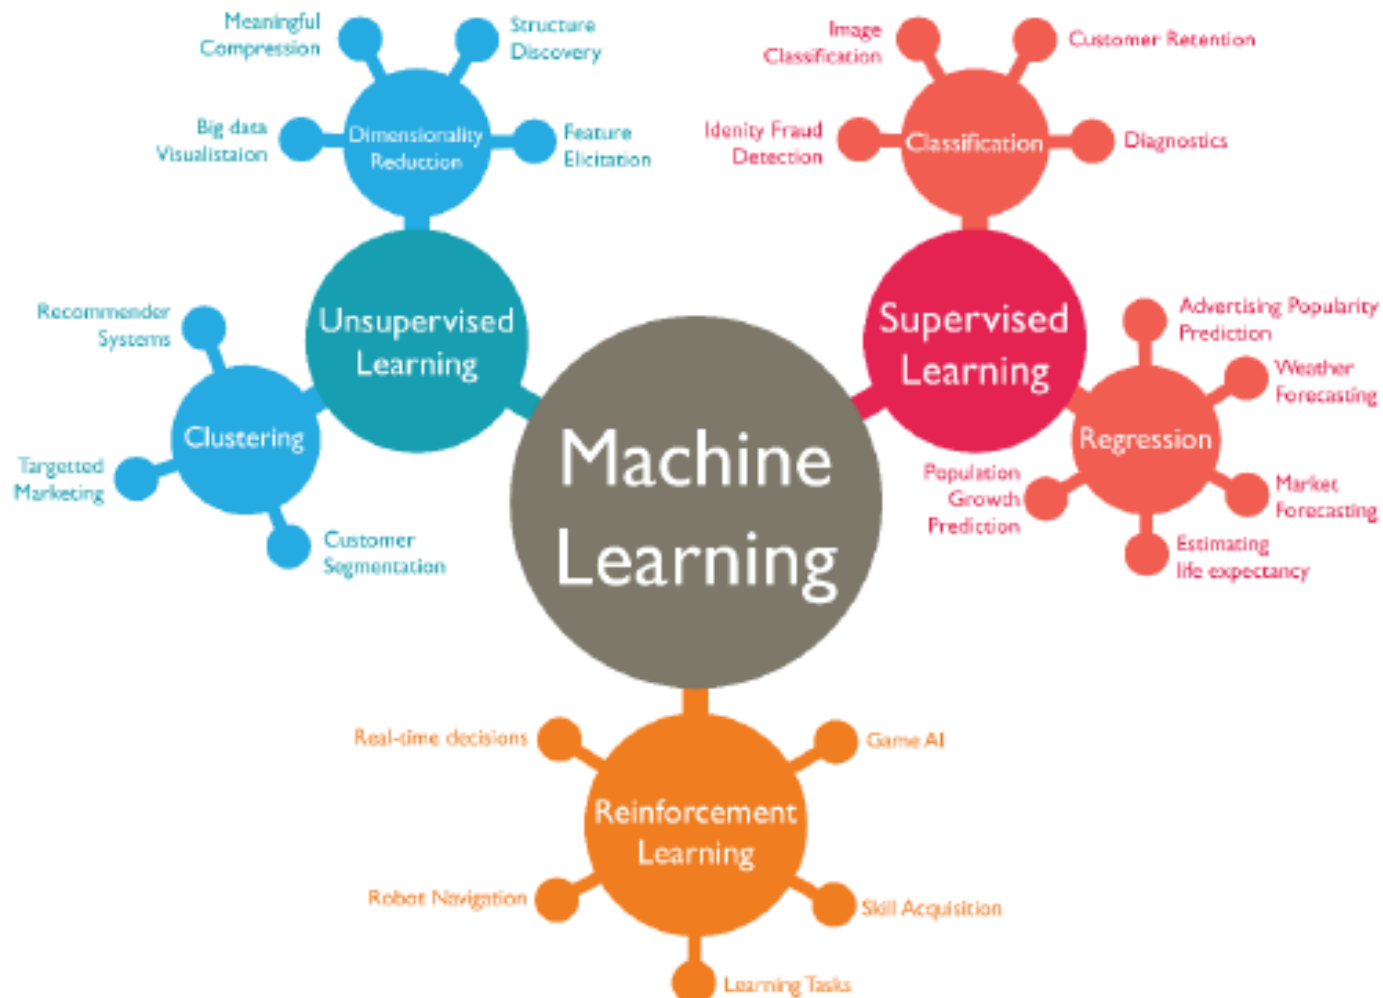

● Player 🔴 learns that he made a mistake somewhere along the way!
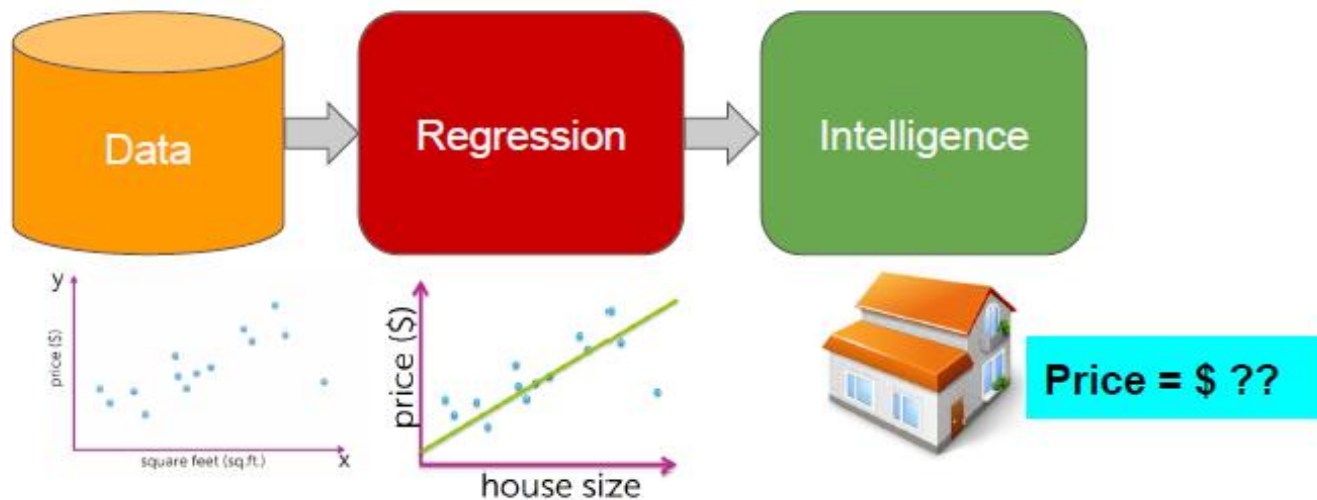

Machine Learning Algorithms
Machine Learning Applications

Machine Learning in this course
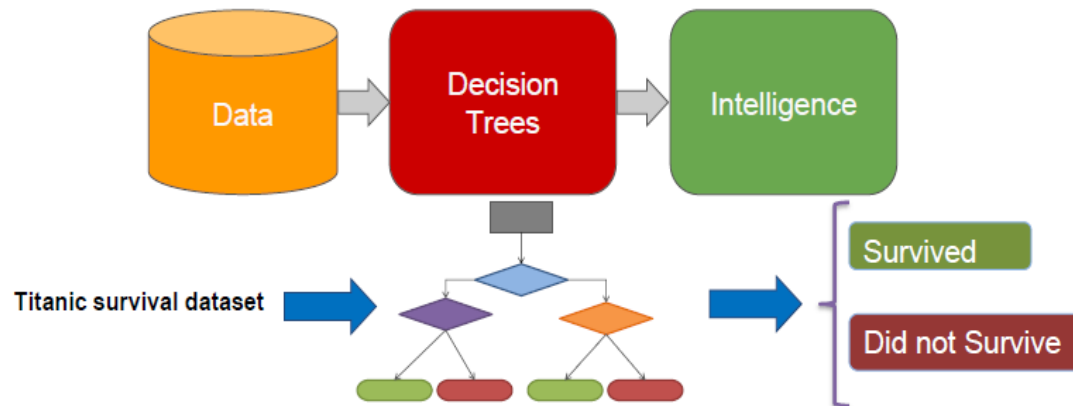

- **Regression**
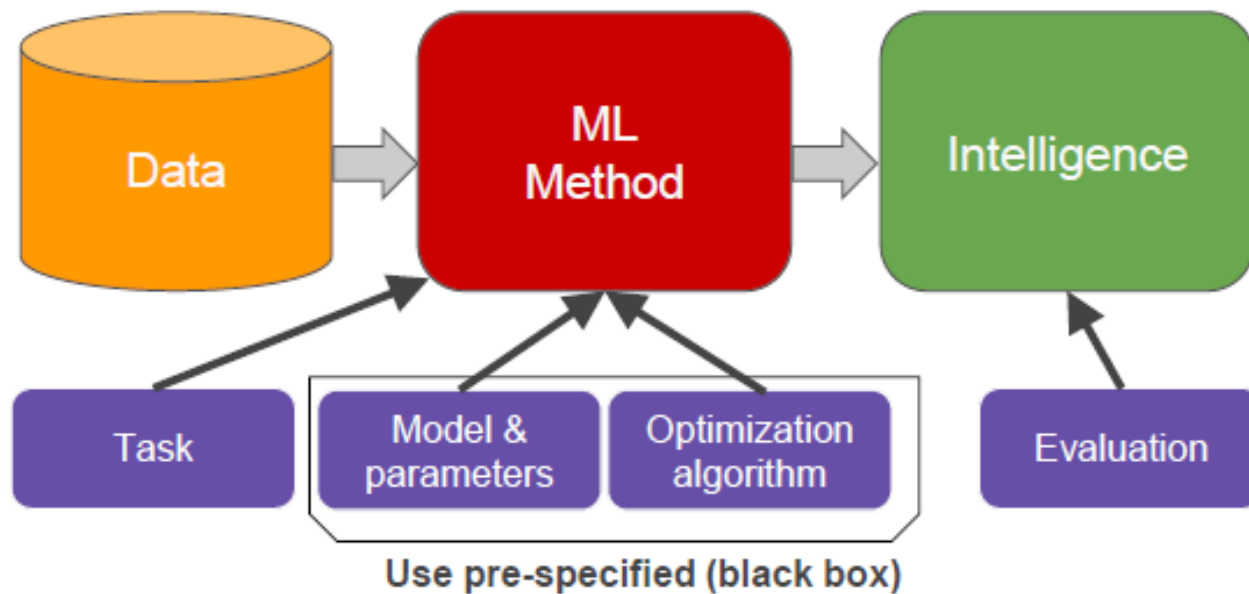

Machine Learning in this course

▸ **Classification (Logistic Regression)**

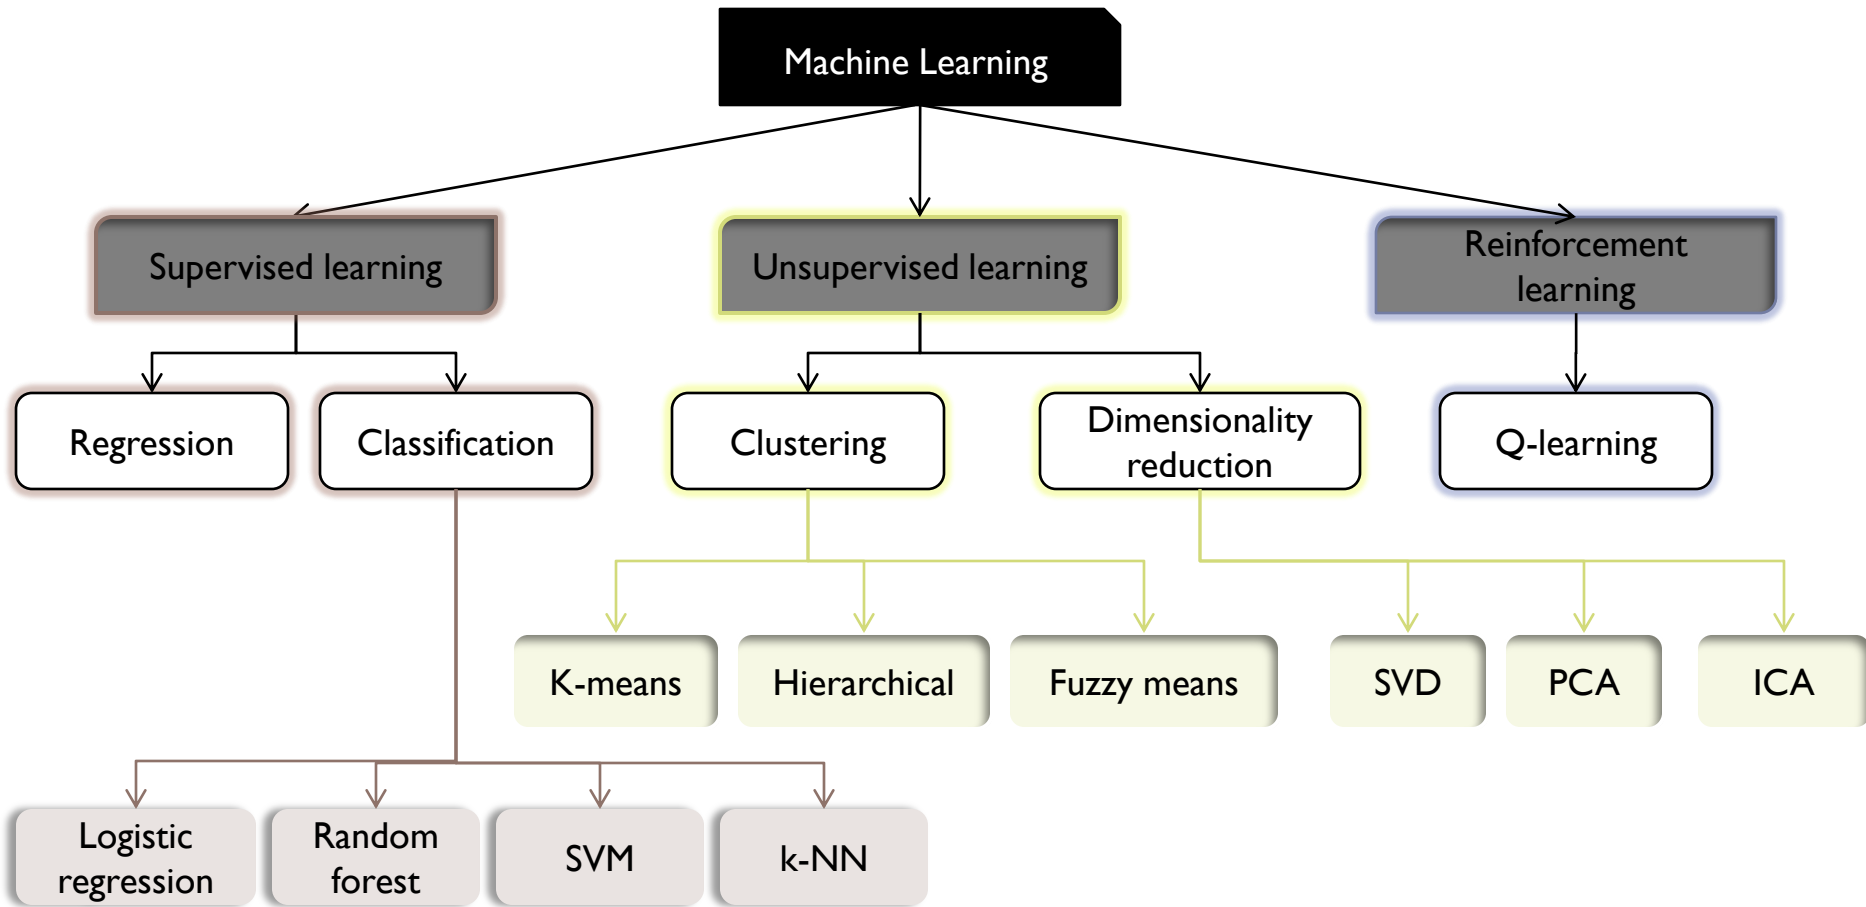

▸ **Classification (Decision Trees)**

1.3
Machine Learning Tools

Machine Learning Tools

- Machine Learning programming languages

- Machine Learning Libraries

- Machine Learning Tool Interfaces

  - Graphical User Interfaces

  - Command Line Interfaces

Python

- Python is a high level language

  - It is optimized for reading by people instead of machines

- Python is also an interpreted language which means it is not compiled into machine code

- It is commonly used in an interactive fashion

  - Java & C: write code, compile and run, and then watch the output

  - Python: write and run line by line with the interpreter

Python

▸ This is very useful for tasks that require a lot of investigations (data cleaning) versus those that require a lot of design !

▸ Different from C++ and java, Python is dynamically typedlanguage (like javascript) : you declare the variable and assign a value to it directly !

  ▸ This enables to quickly set the variable type and content

Why Python for Machine Learning ?

▸ Python is easy to learn

  ▸ Now the language of choice for 8 of 10 top US computer science programs (Philip Guo, CACM)

▸ Full featured

  ▸ Not just a statistics language, but has full capabilities for data acquisition, cleaning, databases, high performance computing, and more

▸ Strong Data Science Libraries

  ▸ The SciPy Ecosystem

▸

Tools to be used in this Course

‣ Programming language to be used in this course: Python

‣ Libraries:
  ‣ Pandas
  ‣ Numpy
  ‣ Scipy
  ‣ Scikit-Learn

‣ Interactive tools:
  ‣ Spyder: IDE for python
  ‣ Jupyter Notebook: A web application that allows to:
    ‣ create and share documents that contain live code, equations, visualizations and explanatory text. Uses include: data cleaning and transformation, numerical simulation, statistical modeling, machine learning and much more.

Pandas

▸ Created in 2008 by Wes McKinney

▸ Open source New BSD license

▸ 100 different contributors
